

```
#a question asks for the user's name and the name variable stores the name that the
user provided from the question.
name = input("Hello, what is your name?:")

#prints the phrase "Here's a joke" along with the name given by the user
print ("Here's a joke,", name,":")

#starts the Knock Knock joke by outputting "Knock Knock"
print("Knock Knock")

#a variable question is getting the input of the user to proceed to the next step
question = input()

#Outputs the Who from the Knock Knock jokes
print("Who")

#a variable question is getting the input of the user to proceed to the next step
question = input()

#Outputs the punchline
print("What are you, an owl?")
```
